District-scale multi-deposit potential.

FRONTIER GOLD PROJECT

- **Ghana's** emerged coastal plain and submerged continental shelf form a single, continuous surface
- **Pleistocene Epoch:** ~2.5M – 11,000 years ago saw at least 17 Glacial – Interglacial cycles
- **Interglacial periods:** melting glaciers, catastrophic rainfall, powerful (high-energy) river flows (all due to climate change) result in intensified erosion
- **Last Glacial Max:** ~20,000 years ago; sea levels ~120m lower; emerged coastline 30 – 50 km further out to sea
- **Approximately 400 – 600 vertical meters** of oxidized, Gold-bearing bedrock in SW Ghana has been eroded & carried to the ocean, much of this, during the last glacial maximum

"The amount of gold that has been weathered away from the (SW) Ghana gold districts & carried to the Ocean by major rivers would suggest eroded inventory is likely in the order of **~200 million oz.**"
